## **1. Introduction**

### **1.1 Background**

The Department of Defense (DoD) Air Force Continuous Acquisition and Life-Cycle Support (CALS) Test Network (AFCTN) is conducting tests of the military standard for the Automated Interchange of Technical Information, MIL-STD-1840A, and its companion suite of military specifications. The AFCTN is a DoD sponsored confederation of voluntary participants from industry and government managed by the Electronic Systems Center (ESC).

The primary objective of the AFCTN is to evaluate the effectiveness of the CALS standards for technical data interchange and to demonstrate the technical capabilities and operational suitability of those standards. Two general categories of tests are performed to evaluate the standards; formal and informal.

Formal tests are large and comprehensive, which follow a written test plan, require specific authorization from the DoD, and may take months to prepare, execute, and report.

Informal tests are quick and short, used by the AFCTN technical staff, to broaden the testing base. They include representative samples of the many systems and applications used by AFCTN participants. They also allow the AFCTN staff to gain feedback from many industry and government interpretations of the standards, to increase the base of participation in the CALS initiative, and respond to the many requests for help that come from participants. Participants take part voluntarily, benefit by receiving an evaluation of their latest implementation (interpretation) of the standards, interact with the AFCTN technical staff, gain experience using the standards, and develop increased confidence in them. The results of informal tests are reported in Quick Short Test Reports (QSTRs) that briefly summarize the standard(s) tested, the hardware and software used, the nature of the test, and the results.

## 1.2 Purpose

The purpose of the informal test, reported in this QSTR, was to analyze Texas Instruments' interpretation and use of the CALS standards in transferring technical publication data. Texas Instruments' used its CALS Technical Data Interchange System to produce data, in accordance with the standards, and delivered it to the AFCTN technical staff on two 9-track magnetic tapes.

---

## 2. Test Parameters

Test Plan: AFCTB 92-034

Date of  
Evaluation: 15 June 1992

Evaluator: George Elwood  
Air Force CALS Test Bed  
DET 2 HQ ESC/ENCP  
Suite 300  
4027 Colonel Glenn Hwy  
Dayton OH 45431-1672

MIL-R-28002A

MIL-D-28003

### **3. 1840A Analysis**

#### **3.1 External Packaging**

The tapes arrived at the Air Force CALS Test Bed (AFCTB) enclosed in a box in accordance with ASTM D 3951. The exterior of the box was marked with the magnetic tape warning label, as required by MIL-STD-1840A, para. 5.3.1.3.

The tapes were enclosed in a barrier bag as required by MIL-STD-1840A, para. 5.3. .2. Inspection of the tape reels showed the label indicating the recording density, as required by MIL-STD-1840A, para. 5.3.1. Enclosed in the box was a packing list showing all files recorded on the tapes.

#### **3.2 Transmission Envelope**

The 9-track tapes received by the AFCTB contained MIL-STD-1840A files. The files were named per the standard conventions. Two tapes were delivered to the AFCTB. The tapes contained the same files but were written using different computer systems. Tape one was written using a UNIX based system while tape two was written using a VAX based system.

##### **3.2.1 Tape Formats**

The tapes were run through the AFCTB *Tapetool* v1.2.8 utility. One error was encountered while evaluating the contents of the tape labels. *Tapetool* reported use of reserved spaces in the header. When the header was checked, no printed values were noted.

\*\*\* ERROR (ANSI X3.27; 8.3.1.1) - Columns 12-24 are reserved  
for future standardization and must be spaces.

Both tapes contained the same error. When further investigation was conducted, it was discovered that the AFCTN *Tapetool* v1.2.8 had three minor errors. One of these errors generated this error message. The tape was in fact written correctly. The AFCTN *Tapetool* will be corrected.

## 3.2.2 Declaration and Header Fields

No errors were reported during the evaluation of Document Declaration file header and data header files on either tape.

## 4. IGES Analysis

### 4.1 Tape One Document One

Tape one contained six IGES files in two documents. The first document contained four IGES files and the second document contained two files. The files were evaluated using IDA's *Parser/Verifier* with CALS options set for Class I files. The reported errors were the same for all files. The required CALS header information in the Start Section was included as required by MIL-D-28000A.

The first reported error was a basic IGES caution. The verifier found zero length lines in all of the files.

\*\*\* Entity type: 110  
CAUTION 2336: Zero length line at D 1273.

The next reported error relates to entity type 212. The verifier reported that the text box width is negative or zero.

\*\*\* Entity type: 212  
ERROR 2279: Text box width is negative or zero at D 3847.

212	3938	1	1	0	0	0	0	10100D	3847
212	0	6	2	0				D	3848
		Box width							
vvvvv									
212,1,1,0.0D0,0.2D0,1,0.0D0,0.0D0,0,0,30.830238095238D0,-0.33D0,								3847P	3938
0.0D0,1H1;								3847P	3939

The next reported error is a CALS error in defining a subfigure entity. MIL-D-28000A Table I, Note 4 indicated that index values shall point only to other entity types within this subset. AUTODESK's AutoCAD uses this feature to create numbers and letters by using a set of lines and other entity types. While this is permitted by the ANSI IGES Standards, it is not allowed in CALS.

\*\*\* Entity type: 308

ERROR 4049: Illegal subordinate flag for CALS Class I specified at D 3781.  
Subfigure name at D 3781: 'DTI2'.  
Number of included entities = 252.

308	3875	1	0	0	0	0	0	201D	3781
308	0	0	22	0			DTI2	D	3782

308,0,4HDTI2,252,3783,3785,3787,3789,3791,3793,3795,3797,3799, 3781P 3875  
3801,3803,3805,3807,3809,3811,3813,3815,3817,3819,3821,3823, 3781P 3876

The next reported error is with entity type 406. The parser flagged this as an error. This value was defined as 16 in MIL-D-28000 but was changed in MIL-D-28000A to 15, 16, 17, or 18. This is not an error and was reported due to an older version of IDA's parser/verifier in the AFCTB.

\*\*\* Entity type: 406

ERROR 4042: Illegal form for CALS Class I specified at D 4883.

406	4939	1	1	0	0	0	0	20000D	4883
406	0	5	1	15				D	4884

File D001Q008 contained the following reported error. A property pointer of 1, 2, or 3 is now permitted in MIL-D-28000A and therefore is not an error.

\*\*\* Entity type: 404

Drawing at D 3205 contains 1 views.

Drawing at D 3205 contains 0 annotation entities.

ERROR 4019: CALS Class I requires exactly one property pointer at D 3205.

404	3177	0	0	0	0	0	0	300D	3205
404	0	0	1	0				D	3206

404,1,3207,0.0,0.0,0,0,3,3209,3211,3213; 3205P 3177

Below are listed additional errors found in file D001Q009.

110	7523	1	1	9	0	0	0	10200D	7331
110	0	5	2	0				D	7332

110,22.590995227505D0,0.40496484969541D0,0.0D0,  
22.637793325626D0,0.40496484969541D0,0.0D0;

7331P 7523  
7331P 7524

When Rosetta Technologies' *Prepare* was used to convert the files, an error message was generated and the process stopped. The error message on all of the files was a missing terminate section. When the files were checked with a word processor, it appeared that the characters rapped at the end of a line resulting in the termination section being off four characters. All four IGES files were successfully converted, displayed and printed using AUTODESK's *AutoCAD*, Cadkey's *Cadkey*, and IDA's *IGESView*.

During the conversion using AUTODESK's *AutoCAD*, many invalid slants in the general note errors were displayed. This occurred on all files. The files all displayed and printed correctly. If the text was slanted, it was converted to a normal text mode.

No errors were generated during the conversion of the files using Cadkey's *Cadkey*. The text displayed and printed showing a slant. It was noted on the display and printed copy of file D001Q008 and D001Q010 that straight lines were present. The other CAD systems did not display these lines which were hidden. *Cadkey* does not support hidden lines.

The files were converted, displayed, and printed with no reported errors using IDA's *IGESView*.

## 4.2 Tape One Document Two

Tape one, document two contained two IGES files. The document and files are the same as AFCTB QSTR 91-067 from *ArborText*. When the files were read off the tape, the IGES files were reported as being invalid. When checking the files visually, it was noted that they contained two CALS header records. *Tapetool* removed the first header and left the second. This problem was generated during the tape generation procedure. When these files were evaluated during QSTR 91-067, no CALS MIL-D-28000 errors were reported.

## 5. SGML Analysis

### 5.1 Tape One Document One

The Text file from tape one, document one was evaluated using Exotercia's *XGMLNormalizer*. The DTD and Text files were parsed without a reported error.

### 5.2 Tape One Document Two

Tape one, document two contained two DTDs and a Text file. These files were evaluated in QSTR 91-067. The comments from that report are included here.

The Text files from this document were evaluated using Exoterica's *XGMLNormalizer* parser. The tape had a DTD based on MIL-M-63038. Also included on the tape was the math entity subset developed by ArborText. The DTD had to be modified slightly to parse successfully using the Exoterica software. The references to the CGM, IGES and Raster content notation declarations had to be added to the basic DTD. After these notation references were added, several errors were reported in the DTD. The first of these errors was the use of NDATA IGS instead of NDATA IGES as defined in MIL-M-28001A, para. 40.1. This was changed in the DTD to reflect IGES. The second error noted was the use of TIFF. TIFF is a Raster format that does not meet MIL-R-28002A specification. Even though the files were defined as TIFF, they are in fact valid MIL-R-28002A images. No notation was included for this type of file and these lines were commented out. After completing these modifications, the DTD parsed without any reported errors.

```
<!ENTITY testligns SYSTEM "test_iges_1.drw" NDATA IGS>
```

```
<!ENTITY testlg4 SYSTEM "test_g4_1.tif" NDATA TIF>
```

```
<!ENTITY seal.dod SYSTEM "dod.tif" NDATA TIF>
```

---

```
<!ENTITY sh60.sideview SYSTEM "sh60.sideview" NDATA IGS>
<!ENTITY entities SYSTEM "entities.sub">
```

The successfully parsed DTD was then used as the baseline for the Text file D001T001. Only one error was reported with this file. The use of "entities" was flagged as an error. This external reference was included in the DTD.

```
C:\XGML\XGMLNORM.EXE --
Error on line 401 in file \9167\d001t001:
Invalid file specification (external identifier).
For the entity 'entities':
The system id is "entities.sub".
The public id is "".
```

When the DTD line addressing this external file was changed to identify the file and its path, the parser did not report any errors.

## 5.3 Tape Two

The SGML files from tape one and tape two were compared with a DOS utility. The files were found to be the same with the exception of header information.

## 6. Raster Analysis

### 6.1 Tape One Document One

Tape one, document one contained five Raster files. These files were evaluated using the AFCTN *validg4* utility. Files D001R011 and D001R012 were reported as being invalid CALS files. The error was reported on the first line of the file. The remaining files were reported as correct. From the CALS note record, it was determined that these files had been converted using Inset Systems *HiJaak*.

When the files were converted using Rosetta Technologies' *Pre-prepare*, file D001R011 converted and displayed with scan line 0 code error noted. The error was very noticeable in the resulting hard

copy. File D001R012 would not convert with a bad file error message generated. The remaining files converted, displayed, and printed without a problem.

The files were converted using Inset Systems' *HiJaak* to a PCX format and viewed on the screen. File D001R011 and 12 displayed the misplaced pixels. The files were imported into Corel's *Ventura Publisher* and printed. This print is included in the Appendix to this test report.

## 6.2 Tape One Document Two

Tape one, document two contained three Raster images. All three images were reported as invalid CALS Raster files by the AFCTN *validg4* utility. The reported errors are at the end of the files and relate to the EOF coding. Even with this problem, the files were successfully read into Rosetta Technologies' *Preview*, displayed and printed. The files were also converted to IMG format using Inset Systems' *HiJaak* and imported into Corel's *Ventura Publisher*. The resulting images are included in the Appendix to this report.

Below is the EOF coding for file D002R002. The correct EOF coding should be 000040 001000.

```
0032220 005545 107131 014213 054414 100156 145153 145455 040620

## 6.3 Tape One Document Three

Tape one document three contained two Raster images. These images were the same ones reported on in QSTR 91-067. A file compare was made of the files and they were verified as the same. The comments from that report are included below with changes made to indicate the correct file names.

Both Raster images were checked using the AFCTN *validg4* utility. The first file, BD001R006, was reported as not being a valid MIL-R-28002A file. Even though file D001R006 was reported as having an error, it was successfully converted using Rosetta Technologies' *Preview*. The image displayed on the screen and a

---

hard copy was made. It was noted on the screen and hard copy that the image appeared to be clipped. Part of the left and right side of the image appear to be missing. When the image was viewed using the AFCTN *calstb.350* Raster utility, the defined pixel and line count appeared to be present. It was noted that one of the arrow lines on the right side of the file had a slight bend in it. This was not noted in any of the other displays. This bend appears to be on line 469. The file was also converted to a IMG format using Inset Systems' *HiJaak*. The file converted without a problem. The resulting IMG file was imported into Corel's *Ventura Publisher* and a hard copy was made.

density = 200  
path length = 1120  
scan lines = 849  
bit format = MSB

error, scan length exceeds pel count  
s=469 a0=0 bstop=1121 pos=3945

file = d001r006

The second Raster file, D001R007, was reported as being a valid file by the AFCTN *validg4*. The image was displayed and printed using Rosetta Technologies' *Preview*. The image displayed without a problem using the AFCTN *calstb.350*.

The conversion using Inset Systems' *HiJaak* to a IMG format was without a reported error. Corel's *Ventura Publisher* imported and generated a hard copy without a problem.

## 6.4 Tape Two

The files on both tapes were compared using a DOS utility. The files were reported as exact duplicates with the exception of some header information. All files were run against the AFCTN *validg4* with the same results on both tapes.

---

## 7. CGM Analysis

### 7.1 Tape One Document One

Tape one, document one contained six CGM files. File D001C001, a file created using the Micrografx *Charisma* v2.1, was reported as being a valid CGM file by ATC's *MetaCheck* software with CALS extensions but not a valid MIL-D-28003 CALS CGM file. The first error was the missing metafile description string which is required in MIL-D-28003. The second error was an invalid transparency indicator. The complete error log is in the Appendix to this report. The file was read and displayed correctly using ATC's *CGMView* when a monochrome option was selected. The image is shown as black lines on a black background. A hard copy is included in the Appendix to this report. The file was imported into SPC's *Harvard Graphics* 3.0. The black lines on black background did not display. When the background color was changed the image displayed correctly.

Files D001C002 and D001C006, were created using *GEM Draw* v2.01, were reported as not meeting basic CGM requirements by ATC's *MetaCheck*. A color index which differs from the background color defined was found. Incomplete parameter data for some elements were reported. Four elements were used in the file that were not defined in the metafile element list. The file was also missing the MIL-D-28003 description statement and more than four fonts were used in the file. The file was imported and displayed using ATC's *CGMView*. A hard copy is included in the Appendix to this report. The file was imported into SPC's *Harvard Graphics* and displayed correctly. File D001C006 printed as an outline in SPC's *Harvard Graphics* and a solid black image in ATC's *CGMView*.

File D001C003, a file created using *Interleaf* v5.2, does not meet basic CGM requirements. A foreground and background color reference problem was reported along with an incomplete metafile element list. The MIL-D-28003 description statement was missing along with more than four fonts being defined and used in the file. The file was displayed and printed using ATC's *CGMView* without a reported problem. When the file was displayed in SPC's *Harvard Graphics*, the image was black with no lines.

Files D001C004 and D001C005 created using the Micrografx *Charisma* v2.1, were reported as not meeting MIL-D-28003 specification. The CALS description statement was missing along with an invalid transparency indicator. File D001C004 was displayed and printed using ATC's *CGMView* and SPC's *Harvard Graphics* without a problem. SPC's *Harvard Graphics* was unable to handle the transparency issue and generated a black image.

## 7.2 Tape One Document Two

Tape one, document two contained one CGM file. This file was Bcreated using Interleaf's software. The file was reported as not meeting basic CGM requirements due to missing elements in the metafile list. The file also did not meet MIL-D-28003 specification because of the missing CALS statement and more than four fonts were used. When the file was read into ATC's *CGMView* no errors were reported and the image displayed and printed without a problem. No Text was noted on the image. The file was also read into SPC's *Harvard Graphics* with reported errors. A clipping error was reported. The image displayed and printed without any other problems.

## 7.3 Tape One Document Three

The comments below are from QSTR 91-067 with changes made to reflect the correct file names.

The tape contained two CGM files. These files were parsed using ATC's *MetaCheck*. Both files were reported containing errors which made them invalid CGM files. Even though the parser reported both files as being valid MIL-D-28003 CGM files, the basic error in the files resulted in both files not meeting the specification.

File D001C002 was reported with one error and is shown below.

Error 4011: Element Class/ID: 0/2    Offset: 4096 octets Element No. 157  
The following elements appear in this CGM and should be indicated in the  
METAFILE ELEMENT LIST:  
    VDC INTEGER PRECISION

File D001C002 was successfully read and displayed using ATC's *CGMView* on the Sun 3/60. No error message was generated during this process. A hard copy was also made from this software package. The file was successfully imported into SPC's *Harvard Graphics 3.0* and displayed. One problem did occur during the import process. The lines on the drawing were black which required a change of background to view.

---

File D001C003 was also reported as not meeting basic CGM specification. Three errors were reported by ATC's *MetaCheck* during the parsing operation.

Bulletin 20009: Element Class/ID: 4/1    Offset: 22914 octets Element No. 1785  
Warning; POLYLINE with only one distinct vertex.

Bulletin 20009: Element Class/ID: 4/1    Offset: 25396 octets Element No. 1835  
Warning; POLYLINE with only one distinct vertex.

Error 4011: Element Class/ID: 0/2    Offset: 73514 octets Element No. 2720  
The following elements appear in this CGM and should be indicated in the METAFILE ELEMENT LIST:  
VDC INTEGER PRECISION

Even though ATC's *MetaCheck* reported the files as not meeting the basic CGM profile, ATC's *CGMView* was able to display the file without a problem. A hard copy was made and is in the Appendix section of this report. The file is part of Air Force CALS Expo '91 demonstration. The file was also successfully imported into SPC's *Harvard Graphics* without a problem.

Even though ATC's *MetaCheck* reported the CGM files as not meeting the basic CGM profile, all softwares available within the AFCTB were able to display and generate hard copies without a problem.

When the two CGM files were evaluated using XSoft's *CAPS/CALS* software, error messages were displayed. File *test1cgm* (D001C002) generated the following error message.

Herderson Software CGM to Postscript converter, version 1.04

ERROR in CGM: Invalid opcode encountered  
class/id: 0/8, offset: 123, element sequence number: 5

ERROR in CGM: Premature end of file  
class/id: 11/125, offset: 4293, element sequence number: 56

The second CGM file, *test2cgm* (D001C003) generated the following error message:

Herderson Software CGM to Postscript converter, version 1.04

ERROR in CGM: Invalid opcode encountered  
class/id: 0/8, offset: 123, element sequence number: 5

ERROR in CGM: Premature end of file  
class/id: 12/0, offset: 74763, element sequence number: 116

---

## 8. Conclusions and Recommendations

In summary, the two tapes from Texas Instruments were basically correct. The tapes could be read properly using the AFCTN Tape-tool software with only one reported error. The reported error was traced to a bug in the AFCTN Tapetool. The tapes were correct. The tapes contained the same data but were written using different hardware platforms. Tape one was written on a SUN UNIX platform while tape two was written on a VAX. Both tapes appeared to have been written using the AFCTN Tapetool utility or Texas Instruments version of this product.

The IGES files contained on the tapes had many minor errors. With the exception of the files in document two which had an additional header file, all files were converted, displayed, and printed from three CAD software packages. Rosetta Technologies' Preview had problems with the line length and an apparent wrap on the last line of the files.

The SGML documents and associated DTD parsed using two different software packages in the AFCTB. No problems were reported during these procedures. Document two parsing information was taken from QSTR 91-067 as the files were the same including the reported errors.

Several of the Raster files had errors reported by the AFCTN *validg4*. The errors reported at the start of the files were noted when the files were displayed and printed. Many of the files were incorrect coding at the end of the file.

The CGM files had many errors. Several of the files were reported as not meeting MIL-D-28003 specification. All CGM files could be displayed and printed using different software packages available in the AFCTB. The issue of transparency did cause the output to look different on the different systems.

Because the number of errors in all file types, the tapes do not meet CALS MIL-STD-1840A requirements.

[illegible]

Technical drawing of a mechanical assembly, labeled "VIEW A-A" and "FIG. 1". The drawing shows a cross-section of a complex machine with various components labeled with numbers and letters. The assembly includes a central shaft with gears, a large flywheel or pulley, and various housing and support structures. The drawing is oriented vertically on the page.

Exploded view diagram of a mechanical assembly, likely a vehicle chassis or engine component. The diagram shows various parts numbered 1 through 100. Key components and callouts include:

- SH 8 (C-7)**: A central component, possibly a shaft or housing.
- SH 8 (C-2)**: A component on the left side.
- SH 8 (A-7)**: A component on the right side.
- F**: A component on the left side.
- H**: A component on the right side.
- REV LTR**: A label for a revised letter.
- MFG SEC NO**: A label for the manufacturing section number.
- VIEW A-A SH (D-7)**: A label for a specific view of the assembly.

The diagram also includes a table at the bottom right with columns for 'Part No.', 'Description', and 'Quantity'.

## 12.5 D001R014 - Preview

**1.2 PURPOSE AND SCOPE.** Texas Instruments is actively implementing a standard methodology for the routine execution of CALS requirements on Department of Defense contracts and incorporating CALS goals into the way Texas Instruments executes its day-to-day business. Texas Instruments understands that the goals of CALS include:

- Integrate Reliability and Maintainability (R&M) engineering into the computer aided design (CAD) and computer aided engineering (CAE) environment.
- Encourage the creation and use of integrated data bases.
- Transition documentation from paper based to digital based media.

Additionally, the DOD is anticipating long-term productivity and quality gains through CALS in the following areas:

- Elimination of error due to outdated or redundant information.
- Savings in cost for manual processes involving the handling and storage of paper based documentation.
- Quicker access to information via access to electronic data bases.

Texas Instruments has carefully reviewed the CALS specifications and standards released to date. The CALS specifications and standards applicable to the <program> contract are contained in Table 1-1.

Table 1-1. CALS Standards and Specifications

Standards/Specifications Number	Application
MIL-STD-1840A	Digital Data Interchange
MIL-STD-1388-2A	Logistics Support Analysis Record
MIL-D-28000	Vector Graphics for CAD (IGES) - Technical Documentation Illustrations - Engineering Drawings - Electronics - Numerical Control
MIL-M-28001	Automated Publishing of Technical Documentation
MIL-R-28002	Raster Scanned Images - Engineering Drawings - Technical Documentation
MIL-D-28003	Vector Graphics for Technical Documentation (CGM)

The CALS requirements imposed on the <program> contract have, in turn, been compared against existing and near term Texas Instruments capabilities. The resulting scenario chosen for CALS execution on <program> is depicted in Figure 1-2.

## 12.6 D001R015 - Preview

### SECTION 1

#### INTRODUCTION TO CALS

**1.1 EXECUTIVE SUMMARY.** Initiated in 1985 by Department of Defense (DOD) policy memorandum, Computer-aided Acquisition and Logistics Support (CALS) is a DOD and industry initiative to enable and accelerate the integration and use of digital technical information for weapon system acquisition, design, manufacture, and support. The CALS program facilitates the transition of current paper-intensive processes to a highly automated and integrated mode of operation, thereby substantially improving productivity and quality of the weapon system acquisition and logistics support process. CALS encompasses the generation, access, management, maintenance, and distribution of technical data in digital form. The evolution of CALS is to be accomplished in a phased approach as depicted in Figure 1-1. Phase 1 of CALS replaces paper document transfers with digital file exchanges and begins the software tool and data base integration process. Phase 2 of CALS will involve substantial software tool integration and a more complete shared data base environment. In December 1988, a CALS Office was created within the Defense Systems & Electronics Group (DSEG) of Texas Instruments to formally address the CALS issues relating to the way Texas Instruments conducts its business on a day-to-day basis. Since the DOD has only released CALS Phase 1 standards and specifications, the Texas Instruments CALS Office has focused on the ability to execute CALS Phase 1 requirements on contract. This plan describes Texas Instruments capabilities to conduct the <program> contract in accordance with currently identified CALS requirements.
